SUMMARY

I've never been satisfied handing something off, I want to see it through to what actually ships. That instinct is why I taught myself to code after winning a couple of inter-college design competitions: an idea in Figma isn't a product yet. Vibe, my latest project, is proof I take that seriously, I built it entirely on my own. I'm looking for a Product Engineer role, somewhere I get to keep working that way.

SKILLS

Design & Product: Figma, Adobe Illustrator, Adobe Photoshop, Framer, Framer Motion, wireframing, user flows, interaction design, prototyping, design systems, accessibility

Front-End Engineering: React.js, Vite, TypeScript, JavaScript, HTML, CSS, responsive & animated UI

Back-End & Data: Node.js, Express.js, REST APIs, SQL, PostgreSQL, pgAdmin

Tools & Workflow: Git, GitHub, Postman, n8n (workflow automation)

EDUCATION

Dayananda Sagar Academy of Technology and Management

Bachelor of Technology, Computer Science and Design · CGPA: 8.6 · 2022–2026

EXPERIENCE

UI Designer & Developer Intern · Hocon Technologies Pvt Ltd

Apr 2026 – Jul 2026

- Delivered four production interface modules (authentication, project dashboards, issue tracking, dependency management) for the company's in-house ERP, translating raw business requirements directly into shipped screens for a 21-person internal team.
- Built a reusable pattern library (cards, filters, modals) adopted across every module, and designed the PostgreSQL schema behind it, with every endpoint verified in Postman before a screen shipped.
- Scoped requirements directly with stakeholders and iterated designs against real usage feedback, eliminating the handoff cycle between design and build entirely, over a 4-month engagement.

Design Intern · Lxl Ideas

Sep 2024 – Oct 2024

- Designed accessible, responsive interfaces in Figma for the Krayon educational app, mapping clear user journeys for a non-technical audience.
- Rebuilt the product landing page's information hierarchy and visual system alongside developers and content teams, carrying the design through to implementation.

PROJECTS

Vibe ↗ · *React, Vite, Framer Motion, Node.js, Express, PostgreSQL, YouTube Data API*

- Built Vibe solo, front to back: a lifestyle app that turns your daily mood into a "vibe" archetype, complete with mini missions, a visual life record called the Life Mosaic, and a space to share photos with friends. Owned the whole stack, from the React/Vite front end to the Node/Express and PostgreSQL backend.
- Connected the YouTube Data API to power mood-based music recommendations, handling the less glamorous parts myself (authentication, rate limits, data shaping) so it holds up in practice.
- Created the entire dark-mode visual language, from type pairing to motion to component library, then built it straight into production React and Framer Motion so nothing got lost between design and code.

Personal Portfolio ↗ · *React, Vite, Framer Motion*

- Designed and coded a portfolio site from scratch, built around a custom ink-and-bronze visual system, Instrument Serif type, and hand-choreographed Framer Motion animation. Nothing pulled from a template.
- Built a Namma Metro-themed scene from the ground up (illustrated train, route map, live departure board) instead of dropping in an off-the-shelf carousel.

Lame Rides ↗ · *Figma · 1st Place, Anokhya 2.0 Inter-College UI/UX Competition*

- Designed a public transport app around route planning and real-time bus tracking, taking it from user research all the way to a high-fidelity prototype.

Connect Smart ↗ · *Figma · 3rd Place, Tech Desafio Inter-College UI/UX Competition*

- Crafted a smart-home management concept with customizable dashboards and automation controls, backed by a full end-to-end design system.
